\* All the contracts in this assignment are deployed on the Sepolia testnet. You can view them on Sepolia Etherscan by clicking the contract address.

## 0.a. Task 1: Deploy ERC20 Token

Contract Address: `0x8a899A996b233bFFc73cBDEf0BDB8817fcd6a4Fb`

**PepeCard**

Account  
`0xdCb4a67ED7740A50261D8086387b07168dba0C4A`

Token Balance  
**998.125 PC**

Buy-in  
**10,000 PC**

Safe Flips  
**1**

Accumulated Rewards  
**45.673 PC**

Next Card Reward  
**+137.019 PC**

**Admin Controls**

Take Out ETH

Mint Free Tokens

**Game Controls**

Leave Game & Collect Rewards

Redeem Tokens (PC)

Enter amount to redeem

2% redemption fee applies

Redeem for ETH

**Purchase Tokens**

ETH Amount

Enter ETH amount

Purchase Tokens

Rate: 0.0001 ETH = 1 PC

Demo website: <https://pepe-card.vercel.app/>

## 0.b. Game Description

PepeCard is a risk-reward card flipping game implemented as a smart contract. Here's how it works:

### 0.b.a. Game Rules

- Players start by buying in with tokens (minimum 100 wei)
- There's a 5x5 grid of cards (25 total)
- One card is randomly selected as the "ghost card"
- Players flip cards one at a time
- Each safe flip earns increasing rewards
- If the ghost card is flipped, the game ends and all accumulated rewards are lost
- Players can "Leave" at any time to collect their accumulated rewards

### 0.b.b. Reward Mechanism

- Rewards increase quadratically with each successful flip
- House edge is 5%
- Base reward formula:  $A * (n^2 + n)$ , where:
  - $A = (25 * \text{buyin} * 0.95) / (5200 * 2)$
  - $n$  = number of successful flips
- Players can redeem(burn) tokens for ETH at a rate of 10000:1 with a 2% redemption fee

### 0.b.c. Only Owner Functions

- `TakeOut()`: Allows the owner to withdraw all ETHs from the contract
- `FreeToken()`: Mints 10000 tokens to the owner

### 0.b.d. Failed Transaction

When a non-owner tries to call the `FreeToken()` function, the transaction will fail with `OwnableUnauthorizedAccount` message. ex:

0xee9389db90693ab65c2addf7b9cd97aabe6e1836413a574924c8b5524aa75829

## 0.c. Task 2: Deploy ERC721 Token

Contract Address: 0xdb319C816aec7cb4F44bC8e825Fe00248457E837

Demo website: <https://trade-offer-ten.vercel.app/>

The Trade Offer contract implements a unique NFT trading system where users can mint and Gacha NFTs.

### 0.c.a. Core Mechanics

- Users can mint new NFTs by providing metadata URIs
- Each minted NFT is held by the contract and adds to the pool
- Minters receive 1 claim credit for each NFT they mint
- Users can claim random NFTs from the pool using their credits (additional fee needed)

### 0.c.b. Only Owner Functions

- `withdraw()`: Allows the owner to withdraw all ETHs from the contract

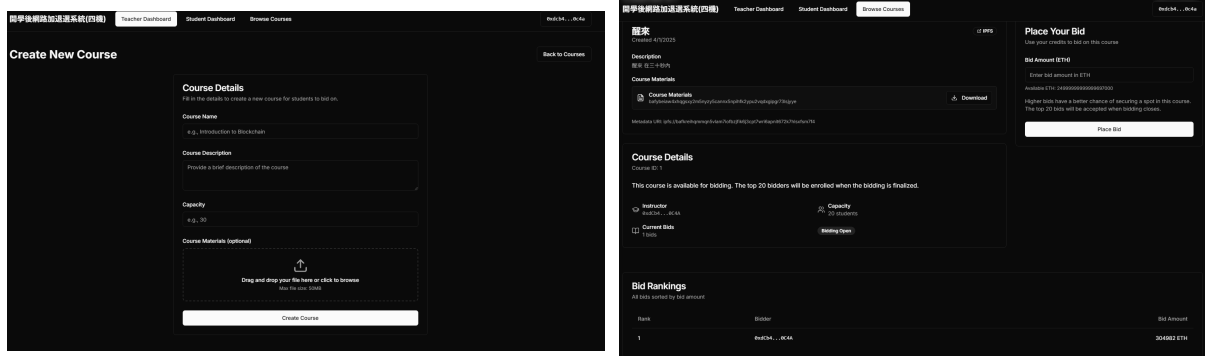

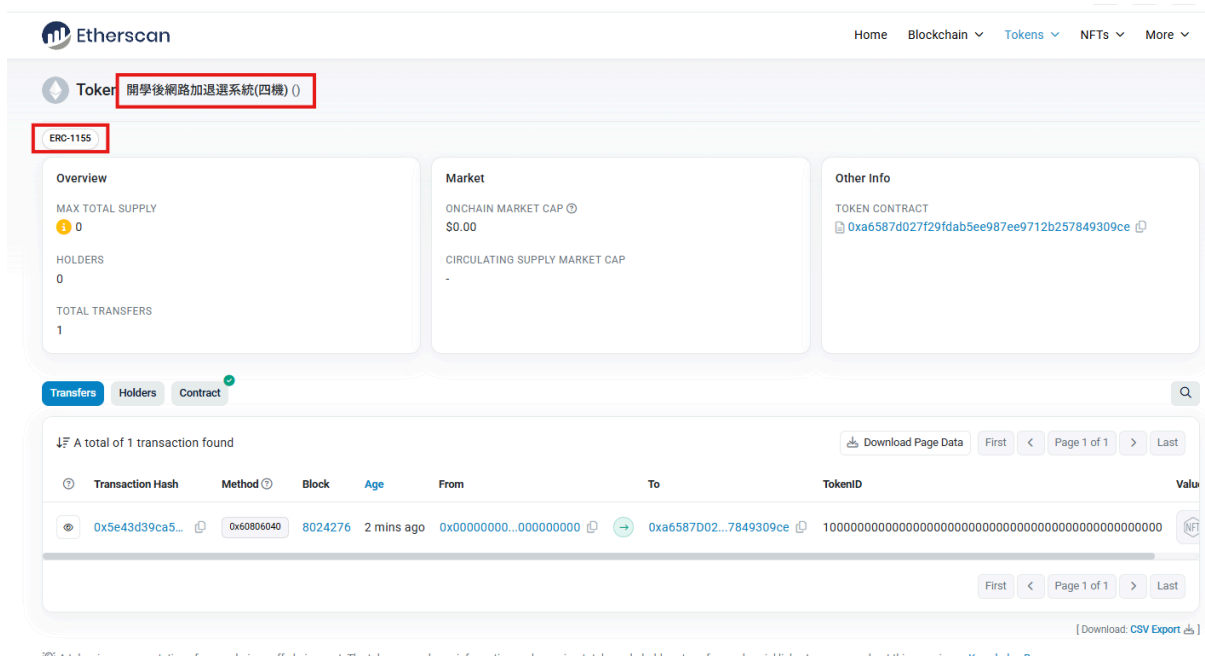

### 0.c.c. Known Issues

- Since you getting a different randomness from the contract every time interacting with it, you may repeatedly try to claim an NFT until you get the one you want.

\* Note: You may check the NFTs on the OpenSea testnet by clicking this text.

### 0.d. Task 3: Deploy ERC1155 Token

Contract Address: 0xa6587d027f29fdab5ee987ee9712b257849309ce

Demo website: <https://isms-nagios.vercel.app/>

The 開學後網路加退選系統(四機) implements a course bidding system with the following features:

## 0.d.a. Core Mechanics

- Students must register to receive 25 ETH initial credits
- Teachers can create courses with specified capacity and metadata
- Students bid on courses using their credits
- Credits are locked during active bids
- When bidding ends, top N bidders (based on capacity) win course slots
- Losing bidders get their credits refunded

### 0.d.b. Key Functions

## 1. Registration

- New students receive 25 ETH initial credits
- Each address can only register once

## 2. Course Creation

- Only addresses with TEACHER\_ROLE can create courses
- Teachers specify capacity and course metadata
- Each course gets a unique courseId
- NFTs are minted to represent course slots

### 3. **Bidding Process**

- Students can bid multiple times on the same course
- Subsequent bids are added to their existing bid amount
- Credits are locked during active bids
- Must have sufficient credits to place bid

### 4. **Finalization**

- Only course teacher can finalize bidding
- System automatically selects top N highest bidders
- Winners receive course NFT as proof of enrollment
- Losing bidders get credits refunded
- Course status changes to “finalized”

## 0.e. Task 4: Deploy ERC721A Token

Contract Address: 0x6a3E113c919E03b3270359461DcacBaaf31C8469

No Demo website available.

- The contract is a simple ERC721A implementation with maximum supply of 500 NFTs.
- Only function implementation is `airdrop(to, quantity)` which allows the owner to mint NFTs to a specified address.

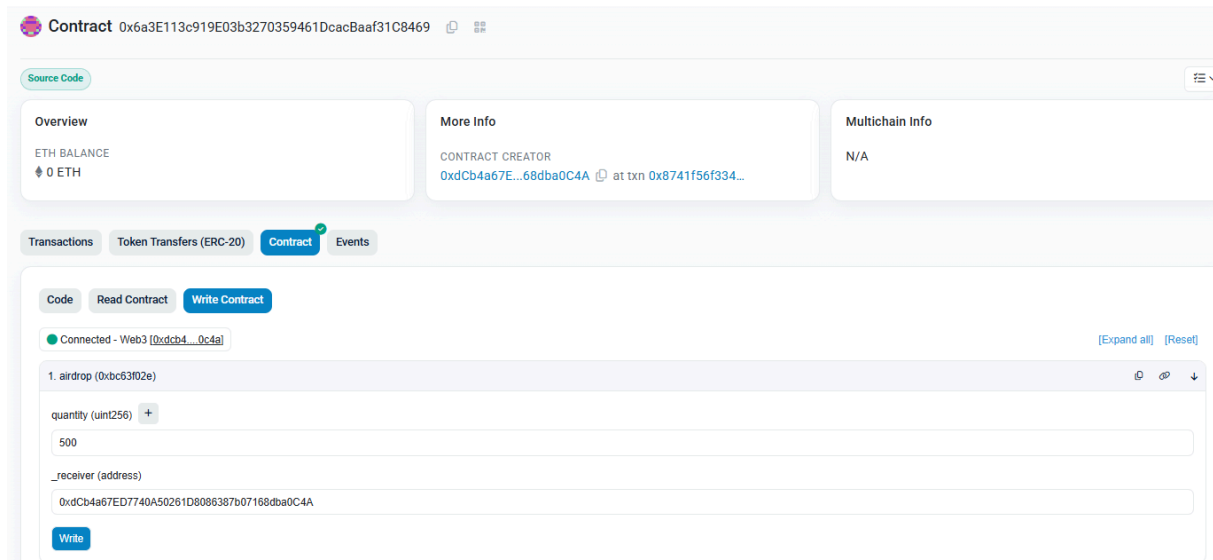

Figure 1: The contract

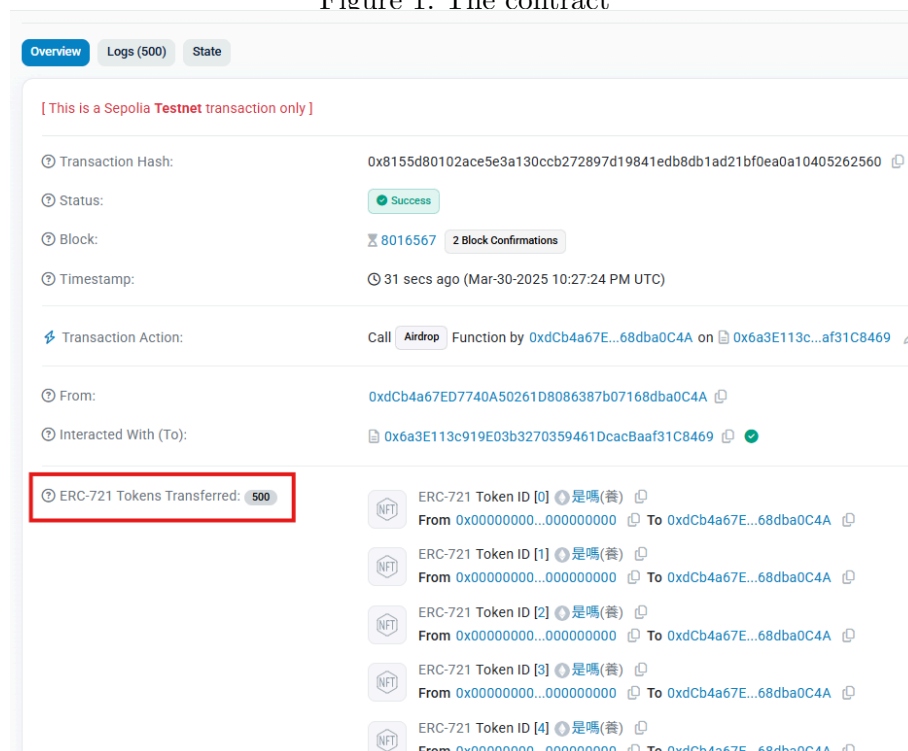

Figure 2: 500 NFTs minted in single transaction

You can check the batch minted NFTs on the OpenSea testnet by the following link: <https://testnets.opensea.io/ja/collection/shi-ma>
